

Data Transformation with dplyr :: CHEAT SHEET

dplyr functions work with pipes and expect **tidy data**. In tidy data:

Each **variable** is in its own **column**

Each **observation**, or **case**, is in its own **row**

`x %>% f(y)` becomes `f(x, y)`

Summarise Cases

These apply **summary functions** to columns to create a new table of summary statistics. Summary functions take vectors as input and return one value (see back).

`summarise(.data, ...)`
Compute table of summaries.
`summarise(mtcars, avg = mean(mpg))`

`count(x, ..., wt = NULL, sort = FALSE)`
Count number of rows in each group defined by the variables in ... Also **tally()**.
`count(iris, Species)`

VARIATIONS

`summarise_all()` - Apply funs to every column.

`summarise_at()` - Apply funs to specific columns.

`summarise_if()` - Apply funs to all cols of one type.

Group Cases

Use **group_by()** to create a "grouped" copy of a table. dplyr functions will manipulate each "group" separately and then combine the results.

`mtcars %>%`
`group_by(cyl) %>%`
`summarise(avg = mean(mpg))`

`group_by(.data, ..., add = FALSE)`
Returns copy of table grouped by ...
`g_iris <- group_by(iris, Species)`

`ungroup(x, ...)`
Returns ungrouped copy of table.
`ungroup(g_iris)`

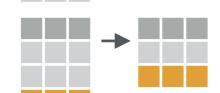

Manipulate Cases

EXTRACT CASES

Row functions return a subset of rows as a new table.

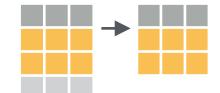

`filter(.data, ...)` Extract rows that meet logical criteria. `filter(iris, Sepal.Length > 7)`

`distinct(.data, ..., .keep_all = FALSE)` Remove rows with duplicate values.
`distinct(iris, Species)`

`sample_frac(tbl, size = 1, replace = FALSE, weight = NULL, .env = parent.frame())` Randomly select fraction of rows.
`sample_frac(iris, 0.5, replace = TRUE)`

`slice(.data, ...)` Select rows by position.
`slice(iris, 10:15)`

`top_n(x, n, wt)` Select and order top n entries (by group if grouped data). `top_n(iris, 5, Sepal.Width)`

Manipulate Variables

EXTRACT VARIABLES

Column functions return a set of columns as a new vector or table.

`pull(.data, var = -1)` Extract column values as a vector. Choose by name or index.
`pull(iris, Sepal.Length)`

`select(.data, ...)` Extract columns as a table. Also `select_if()`.
`select(iris, Sepal.Length, Species)`

Use these helpers with `select ()`,
e.g. `select(iris, starts_with("Sepal"))`

`contains(match)` `num_range(prefix, range)` : e.g. `mpg:cyl`
`ends_with(match)` `one_of(...)` -, e.g. `-Species`
`matches(match)` `starts_with(match)`

MAKE NEW VARIABLES

These apply **vectorized functions** to columns. Vectorized funs take vectors as input and return vectors of the same length as output (see back).

`mutate(.data, ...)`
Compute new column(s).
`mutate(mtcars, gpm = 1/mpg)`

`transmute(.data, ...)`
Compute new column(s), drop others.
`transmute(mtcars, gpm = 1/mpg)`

`mutate_all(.tbl, .funs, ...)` Apply funs to every column. Use with `funs()`. Also `mutate_if()`.
`mutate_all(faithful, funs(log(.), log2(.)))`
`mutate_if(iris, is.numeric, funs(log(.)))`

`mutate_at(.tbl, .cols, .funs, ...)` Apply funs to specific columns. Use with `funs()`, `vars()` and the helper functions for `select()`.
`mutate_at(iris, vars(-Species), funs(log(.)))`

`add_column(.data, ..., .before = NULL, .after = NULL)` Add new column(s). Also `add_count()`, `add_tally()`.
`add_column(mtcars, new = 1:32)`

`rename(.data, ...)` Rename columns.
`rename(iris, Length = Sepal.Length)`
